DETAILS FEATURES CHANGELOG

languages you're using or app types you're building. It allows you to instantly (and [securely](#)) share your current project, and then as needed, share [debugging sessions](#), [terminal instances](#), [localhost web apps](#), and more! Developers that join your sessions receive all of their editor context from your environment (e.g. language services, debugging), which ensures they can start productively collaborating immediately, without needing to clone any repos or install any SDKs.

Additionally, unlike traditional pair programming, Visual Studio Live Share allows developers to work together, while retaining their personal editor preferences (e.g. theme, keybindings), as well as having their own cursor. This allows you to seamlessly transition between [following one another](#), and being able to explore ideas/tasks on your own. In practice, this ability to work together *and* independently provides a collaboration experience that is potentially more natural for many [common use cases](#).

GitLens — Git supercharged

GitKraken gitkraken.com 52,349,281 ⭐⭐⭐⭐☆ (930)

Supercharge Git within VS Code — Visualize code authorship at a glance via Git blame annotations and CodeLens, seamlessly navigate and explore Git repositories, gain valuable insights via rich visualizations and powerful comparison commands, and so much more

Switch to Pre-Release VersionDisableUninstallAuto Update

DETAILSFEATURESCHANGELOG

GitLens — Supercharge Git in VS Code

Understand any line of code, keep every branch, worktree, and coding agent in view, and ship cleaner history — without leaving VS Code.

GitLens is an open-source extension built and maintained by GitKraken, and installed more than 51 million times.

Your repository moves faster than it used to. Coding agents open branches, worktrees pile up, and pull requests stack while you're still reading a diff. GitLens pulls all of it into one interactive view — history, working changes, branches, worktrees, and live agent activity together — then helps you review it, rebase it, and shape it into commits someone can actually read.
